Efemérides do Sol e da Lua

Navegação astronômica — 2027–2035

Edição do Atlântico ao Índico

As horas em torno do meio-dia e da passagem da Lua pelo meridiano de Greenwich (0°)

Atualizado em 13 de novembro de 2026

Conteúdo

- Modo de usar, com um exemplo resolvido passo a passo
- Tábua 1: depressão do horizonte
- Tábua 2: Sol, correção total
- Tábua 3: Lua, correção total
- Tábuas 4 e 5: interpolação do AHG, v e d
- Cada mês, de janeiro de 2027 a dezembro de 2035: a página do Sol e depois a da Lua

© Superlight — superlight.fr — Licença CC BY-NC-SA 4.0: livre para compartilhar e adaptar, sem fins comerciais e sob a mesma licença.

Modo de usar

Um exemplo resolvido passo a passo: o Sol, limbo inferior, em 12 de junho de 2027 às 10 h 23 min 41 s HMG, elevação do olho 2,5 m, erro instrumental +1,4'.

A altura do astro

1 Altura observada. Leia o sextante (altura instrumental a_i) e subtraia o erro instrumental e_i. Com um horizonte artificial, divida o resultado por 2: a leitura é o dobro da altura.

$a_o = a_i - e_i$ — $62°14{,}6' - 1{,}4' = 62°13{,}2'$

2 Depressão. Com o horizonte do mar, some a depressão dp (tábua 1, sempre negativa) para obter a altura aparente a_a. Com um horizonte artificial, nada a somar.

$a_a = a_o + \mathrm{dp}$ — $62°13{,}2' - 2{,}8' = 62°10{,}4'$ (elevação 2,5 m)

3 Altura verdadeira. Some a correção total do Sol (tábua 2) ou da Lua (tábua 3), lida com a_a e, para a Lua, com a paralaxe horizontal PH da página do mês. Ela reúne refração, paralaxe e semidiâmetro: não os aplique de novo.

$a = a_a + \mathrm{corr.}$ — $62°10{,}4' + 15{,}4' = 62°25{,}8'$ (tábua 2)

A posição do astro

4 Ângulo horário. Na página do mês, leia o AHG da hora inteira anterior à observação e interpole para os minutos e segundos decorridos: tábua 4, depois tábua 5 para v, o Δ'/h da linha do AHG (o excesso sobre 15°/h para o Sol, 14°/h para a Lua).

$\mathrm{AHG} = \mathrm{AHG}_h + \text{tábua 4} + \text{tábua 5}\,(v)$ — $330°02{,}6' + 5°55{,}2' + 0{,}0' = 335°57{,}8'$

5 Declinação. Leia a declinação da hora inteira e some a interpolação de d, o Δ'/h da linha da declinação, com o seu sinal.

$\mathrm{Dec} = \mathrm{Dec}_h + \text{tábua 5}\,(d)$ — $23°08{,}9' + 0{,}1' = 23°09{,}0'$ ($d = +0{,}2$)

As tábuas supõem 10 °C e 1010 hPa; abaixo de 10° de altura a refração varia com o tempo e as observações são menos confiáveis. Fórmulas: depressão $1{,}76'\sqrt{h}$; refração de Bennett; paralaxe $0{,}15'\cos a_a$ (Sol), $\arcsin(\sin \mathrm{PH} \cos a_a)$ (Lua); semidiâmetro da Lua $0{,}2725\,\mathrm{PH}$.

Tábua 1 — Depressão do horizonte

As páginas do mês dão o AHG nas horas inteiras; entre elas ele cresce de modo regular, 15° por hora para o Sol e 14° para a Lua. Esta tábua dá o que ele ganha nos minutos (à esquerda) e nos segundos (à direita) decorridos desde a hora inteira: some os dois ao AHG da hora inteira e depois a interpolação de v (tábua 5). Exemplo, Sol às 15 h 30 min 52 s: 7°30,0’ + 13,0’ = 7°43,0’.

Tábua 5 — Correções para v e d

O resto da interpolação: na verdade o AHG cresce v a mais que 15° (14°) por hora, e a declinação d por hora (Δ'/h na página do mês). A tábua dá $\Delta \times min/60$ para os minutos desde a hora inteira; some-o com o sinal de Δ. Para um Δ que não consta, some linhas: Lua, $v = 38{,}3$'/h aos 41 min $\approx 30 + 8 + 0{,}3$: 20,5 + 5,5 + 0,2 = 26,2'.
